Course = BCA

College = IITM College (Janakpuri)

Business Problem Report

Project Title

Adult Census Income Analysis

Business Problem

Income is an important factor that affects a person's standard of living. Many organizations and government agencies want to understand why some people earn a higher income while others earn a lower income. A person's income may depend on different factors such as age, education, occupation, work class, marital status, gender, and the number of hours they work each week.

Without analyzing the available data, it is difficult to identify which of these factors have the greatest impact on income. Understanding these relationships can help organizations improve their hiring process, employee training, workforce planning, and decision-making. It can also help policymakers design better education and employment programs.

The Adult Census Income dataset contains information about thousands of individuals, including their personal and work-related details. By analyzing this dataset, we can identify patterns and trends that explain how different factors are related to income. The dataset also allows us to compare people who earn more than **\$50K** per year with those who earn **\$50K or less**.

Objective

The main objective of this project is to analyze the Adult Census Income dataset and identify the factors that influence a person's income. The project aims to study the relationship between income and features such as age, education, occupation, work class, marital status, gender, and hours worked per week. The analysis will help in understanding which factors are most strongly associated with higher income levels.

➡ **Expected Outcome**

The expected outcome of this project is to identify the key factors that affect income and provide useful insights from the data. The findings can help organizations make better business decisions, improve workforce planning, and understand the characteristics associated with different income levels. The project will also demonstrate how data analysis can be used to solve real-world business problems.
